

The 3-Month Execution Plan

DPDP Compliance Platform — From Zero to MVP + Early Customer Talks

Mission: Ship a working MVP in 12 weeks. Get 3-5 companies actively talking to us about adoption. Be ready to pitch the university accelerator the day classes start with real product, real metrics, and real conversations in pipeline.

Operating Principles

Before the plan, the rules we follow:

1. **Build in public.** Every meaningful milestone goes on LinkedIn and X. Indian SaaS founder community is small and watches builders. Visibility = inbound.
 2. **Sell while you build.** Outreach doesn't pause for product. Every week we keep the funnel warm even if there's nothing to sell yet — we're collecting design partners, not customers, until Week 8.
 3. **One customer this summer is the goal.** Not validation. Not feedback. One real ₹ transaction. Everything is measured against that.
 4. **Research before every build cycle.** Two hours of competitor study before each module saves two weeks of wrong-direction code.
 5. **Ship ugly, ship fast.** First version of every module is functional and embarrassing. Polish comes after a customer cares enough to complain.
 6. **Document everything.** Decisions, learnings, customer quotes — all in one Notion or Obsidian vault. Future-you (and future investor) will need this.
-

The Stack We're Building On

Decisions locked. No bikeshedding mid-project.

Layer	Choice	Why
Frontend	Next.js 15 + Tailwind + shadcn/ui	Standard, fast, AI-friendly
Backend	Next.js API routes + tRPC	Single repo, type-safe, simple
Database	Supabase (Postgres)	Auth, storage, RLS, free tier covers MVP
AI	Claude API (Sonnet 4.6 for analysis, Haiku for summaries)	Best reasoning, predictable costs
Background jobs	Inngest or Trigger.dev	Long-running agent workflows
Hosting	Vercel	Zero-config, fits the stack
Auth	Supabase Auth + magic links	No password infra needed
Email	Resend	Simple, reliable, cheap
Analytics	PostHog (self-hosted free tier)	Product + funnel in one
Payments	Razorpay (India) + Stripe (later, US)	Razorpay first for INR
Domain	<code><yourbrand>.in</code> for India trust + <code>.com</code> for global	₹1500/yr each

Why not microservices, why not Python: Two-person team. One repo, one language, one deploy command. Boring stack wins.

The 12-Week Plan At A Glance

WEEK	PHASE	PRIMARY OUTPUT
1	Foundation	Brand, infra, data audit complete
2	Foundation	Discovery agent V0 working
3	Module Build	Gap assessment agent live
4	Module Build	Policy generator + dashboard
5	Module Build	Trust center + compliance score
6	Sales Sprint	First paid pilot signed
7	Module Build	Consent + rights portal
8	Module Build	Breach notifier + vendor tracker
9	Sales Sprint	3-5 design partners actively engaged
10	Polish	Onboarding flow + analytics

PHASE 1 — FOUNDATION (Weeks 1-2)

Week 1: Set Everything Up Once So You Never Have To Again

Goal

Brand, infra, and the legal Act fully internalized. By Sunday night you should be able to start building without any "wait, do I have access to..." friction.

Tasks

Day 1-2: Brand and Domain

- Lock the company name. Suggestions to test: **Kavach** (shield, but check Kavach One overlap), **Adhikar** (rights), **Suraksha** (security), **Sanrakshak** (protector), **Pravidhi** (compliance/regulation), **Dharma Compliance**, or pure English **Northstar Compliance** / **Compliable** / **Conform**.
- **My pick:** Something English-rooted that scales globally. Indian context as positioning, not as a name ceiling. Test with 5 founders before locking.
- Buy `<name>.in` (₹800) and `<name>.com` if available (₹1500). Skip `.ai` — too expensive, doesn't fit B2B compliance buyer.
- Create logo via Looka or hire one Fiverr designer for ₹2000. Don't spend more than 4 hours on this.
- Set up Google Workspace (₹136/user/month) for `founders@`, `hello@`, `hello@`.

Day 3: Legal entity

- Don't incorporate yet. Operate as an unregistered partnership / sole proprietorship for the first 3-6 months. Save the ₹15,000 setup cost and the compliance overhead.
- BUT do create a basic 2-line co-founder agreement between you and any other co-founder. Even an email exchange acknowledging equity split is enough for now.
- When you sign your first ₹50,000+ contract, incorporate as Indian Pvt Ltd. Use Vakilsearch or RazorpayRize (~₹15K all-in).

Day 4: Infrastructure

- GitHub org (free)
- Vercel account (free)
- Supabase project (free tier)

- Anthropic API account (need a credit card; budget \$50 for first month)
- Resend (free tier, 100 emails/day enough for now)
- PostHog cloud (free up to 1M events)
- Linear or Notion for project tracking — pick one, don't use both
- Notion for documentation vault — create these pages: `Customer Calls`, `Decisions Log`, `Learnings`, `Competitors`, `DPDP Reference`, `Pipeline`

Day 5-7: Deep DPDP Mastery This is non-negotiable. You cannot build DPDP compliance software without knowing the law cold.

- Read the full DPDP Act 2023 — every section, every illustration. Twice.
- Read the DPDP Rules 2025 (notified Nov 13, 2025). Every clause.
- Read the latest 5 articles from Rainmaker Law, KSandK, and Tsaaro on DPDP enforcement.
- Build a personal "DPDP cheat sheet" Notion doc: every section number → obligation → penalty → which of our modules addresses it. Reference it weekly.
- Understand the difference between Data Fiduciary, Data Processor, Significant Data Fiduciary, Data Principal, and Consent Manager. You should be able to explain each to a non-technical founder in 60 seconds.

Deliverable

Brand assets ready. All infra accounts active. Notion vault initialized. You can recite DPDP Section 8(5) and its penalty cap from memory.

Week 2: Build the First Real Thing (Discovery Agent V0)

Goal

By end of Week 2, you can hand someone a URL, they connect their AWS account read-only, and within 5 minutes they see a list of every place personal data lives in their infra. This is the magic moment that earns trust on Day 1 of any future customer engagement.

Tasks

Day 1: Architecture sketch

- Write a 2-page architecture doc in Notion. Pages: `agent_architecture.md`. Cover: how agents communicate, where state lives, how customer credentials are stored, security model.
- Draw the data flow on paper. Photo of paper goes in the doc. Don't over-engineer.

Day 2-3: The shell app

- Bootstrap Next.js project. Set up Supabase auth, Tailwind, shadcn/ui.
- Build login → onboarding wizard → dashboard skeleton.
- Three screens: `Connect`, `Discovery`, `Compliance Score` (last two empty placeholders for now).

Day 4-6: The Discovery Agent

- Build the AWS connector. Customer pastes a read-only IAM access key. We store encrypted in Supabase.
- Use boto3 or AWS SDK in a Vercel serverless function. Iterate over: S3 buckets (list objects, infer PII via name patterns + sample read), RDS (list databases, get schemas, flag fields named `email`, `phone`, `pan`, `aadhaar`, `name`, `dob`, `address`, etc.), DynamoDB (similar field-name detection), CloudTrail (check audit log presence).
- The output is structured JSON: `{ asset_type, location, fields_with_pii, sensitivity_score, evidence_snapshot }`.
- Pass this JSON to Claude with a prompt: "You are a DPDP compliance auditor. Given this asset inventory, generate a human-readable data map for an Indian SaaS founder. Group by data sensitivity. Flag the 3 highest-risk areas. Use plain English, no legal jargon."
- Render the result on the Discovery page.

Day 7: Test with your own infra or a mock account

- Set up a fake "Indian SaaS company" AWS account with deliberately messy data: an unencrypted S3 bucket, an RDS table called `users` with `aadhaar_number`, no MFA enforcement. Make sure your agent finds all of it.
- Record a 90-second screen recording. This becomes your first demo asset.

Research-as-you-build

- Read the AWS Well-Architected Framework's Security Pillar — especially the data classification and protection sections.
- Read 3 customer reviews of Vanta and Drata on G2 specifically about onboarding. Note the exact language users use to describe the "wow" moment vs. the "this is annoying" moment.
- Watch any YouTube demo of OneTrust's data discovery feature. Note what they show, what they hide, and what looks slow.

Deliverable

A working app at a real URL where you can connect a read-only AWS account and within 5 minutes get a data map and a Claude-generated summary highlighting top 3 DPDP risks. Looks rough but works end-to-end. **This is the demo you show in every sales call from Week 6 onward.**

PHASE 2 — MODULE BUILD (Weeks 3-5)

Week 3: Gap Assessment Agent

Goal

After connecting their stack, customer gets a ranked list of every DPDP gap in their environment. Each gap has: a plain-English description, the relevant DPDP section, the penalty exposure in rupees, and a remediation playbook.

Tasks

- Define the canonical control list. Start with 30 controls (not 80 — ship fewer, ship better). Each has: `control_id`, `dpdp_section`, `penalty_cap`, `automated_check_logic`, `manual_check_question`, `remediation_steps`.
- Categories to cover in V1: encryption at rest, encryption in transit, MFA enforcement on cloud accounts, audit logging enabled, S3 bucket public access, password policy strength, data retention configuration, vendor list completeness, breach notification readiness.
- Build the assessment runner: takes the discovery JSON + the control list → runs each automated check → generates a result row per control.
- Build the gap report page. Sortable by severity. Each gap is a card showing: description, what's wrong specifically in their environment, exact DPDP section, the rupee exposure, and a "Remediation steps" expandable.
- Add Claude-powered remediation generator: for each failing control, prompt it to generate step-by-step instructions specific to that customer's environment. Cache results to avoid repeated API calls.

Research

- Read `cloudsecurityalliance.org` Top Threats reports — extract the patterns they recommend checking for.
- Read CERT-In guidelines (the Indian cybersecurity authority's directives) — understand what "reasonable security safeguards" means in Indian regulatory practice.
- Pull the public Trust Service Criteria (TSC) for SOC 2 from AICPA. Many overlap with DPDP — understanding both now saves work for the V2 SOC 2 module.

Deliverable

End-to-end flow: connect → discover → assess → ranked gap report with rupee exposures. **You can now sell from this.**

Goal

Customer can generate the 12 core DPDP policy documents customized to their company in one click. Customer dashboard shows ongoing status across modules.

Tasks

- Write your 12 policy templates in markdown. Use language from existing public templates (Tsaaro, dpdpa.com, Rainmaker resources) but rewrite in plain English, structured for Indian SaaS context.
- The 12: Information Security Policy, Privacy Policy, Data Retention Policy, Incident Response Plan, Business Continuity Plan, Vendor Management Policy, Access Control Policy, Data Classification Policy, Acceptable Use Policy, Change Management Policy, Encryption Policy, Breach Notification Policy.
- Build the policy generator: customer fills a 20-field intake form (company name, tech stack, headcount, data types, etc.) → backend stitches their inputs into the templates → outputs 12 customized PDF + DOCX files.
- Use Claude to add an additional layer: "Given this company's tech stack and the data they collect, customize this policy template with specific examples relevant to them."
- Dashboard improvements: show overall compliance score (% of controls passing), policies generated, days until enforcement deadline, last assessment timestamp.

Research

- Read 3 actual privacy policies of well-known Indian SaaS companies (Razorpay, Zoho, Freshworks). Note the structure, the specificity, the language. Yours should sound similar in voice but be more compliant.
- Read the EY India and Deloitte India DPDP readiness reports. Extract every "this is what compliance looks like in practice" insight.

Deliverable

A founder with no compliance team can generate a complete starter policy set for their company in 15 minutes. Dashboard shows them where they stand at a glance.

Week 5: Trust Center + Compliance Score

Goal

Build the **single feature that drives most conversions**: a public, shareable URL where a customer can show their compliance posture to investors and prospects.

Tasks

- Design the public-facing trust center page. Inspiration: Vanta's trust center, Drata's trust center, Hubspot's trust center. Indian B2B trust visual context: clean, conservative, professional. No bro-marketing tone.
- Per customer: a unique URL like `trust.<ourbrand>.in/<customer-slug>`. Shows compliance score, certifications in progress, security controls passing, latest policy version dates, link to request the full audit package.
- Backend: pulls live data from the customer's compliance state. Auto-updates daily.
- Privacy controls: customer chooses what's public vs. NDA-gated. NDA-gated content shows a "Request access" button that triggers a workflow.

Research

- Visit 10 real trust centers. Note: Vanta-built, Drata-built, custom-built. Screenshot every section. Extract the patterns.
- Read 3 LinkedIn posts from Indian CTOs talking about how they showed compliance to enterprise customers. The language they use becomes your marketing copy.

Deliverable

The conversion driver. When you demo this in sales calls, founders' eyes light up. This is the feature that justifies the price.

PHASE 3 — FIRST SALES SPRINT (Week 6)

Week 6: Get One Paying Customer

Goal

Close one paying customer at ₹15,000–25,000/month or ₹50,000 one-time. Not a free pilot. Real money.

Tasks

Daily for 7 days:

- 2 hours: outbound (LinkedIn + X DMs + email)
- 2 hours: customer calls (demos)
- 1 hour: follow-ups
- 2 hours: small product fixes based on feedback from calls
- 1 hour: documentation

Outreach targets this week:

- Re-engage the 15-20 LinkedIn people you've already messaged. New angle: "I have a working demo now. Would you spend 15 minutes seeing it? Not selling — want your feedback as a CTO."
- 30 new LinkedIn connection requests to CTOs at funded Indian B2B SaaS, focusing on fintech, HR tech, healthtech.
- Post on Reddit (r/IndianStartups, r/StartupIndia, r/legaladviceindia): "I built a DPDP compliance platform. 3 minute demo for any Indian SaaS founder who wants to see what their compliance gaps look like."
- Post on X with your demo video. Tag SaaSBOOMi, NASSCOM, prominent Indian SaaS angels (Kunal Shah, Nithin Kamath, Aakash Kumar Sehgal — no DM, just visibility).
- Cold email 25 CTOs using Hunter.io free tier.

Sales call playbook:

1. Background question: "Tell me about your company and how you handle data today" (5 min — let them talk)
2. Pain probe: "Have you started thinking about DPDP? What's your current plan?" (5 min)
3. Live demo: connect their AWS in real time during the call. Show their actual gaps. The wow moment is real. (10 min)
4. Price + ask: "₹15K/month for the first 6 months as a design partner. Includes our hands-on support. Ready to start this week?"
5. Handle objections. Most common: "Let me check with my co-founder." Response: "Sure — when can the three of us talk? I have time tomorrow."

What success looks like end of Week 6

- 1 paying customer signed (₹2 lakh ARR locked)
- 5-8 conversations actively in progress
- Pipeline: 15+ founders in some stage of conversation
- Demo video has 200+ views on LinkedIn
- Reddit post got 30+ comments

What if no one buys yet?

Don't panic. Reset expectations.

- Lower price for first 3 customers to ₹5,000/month for 6 months — design partner pricing in exchange for case study rights.

- Or: ₹50,000 one-time DPDP readiness assessment. Even cheaper than CA firm. Easier first yes.
- The goal is the relationship and learning, not the revenue. ₹5K/month × 3 customers = enough to claim "paying customers" in any pitch.

Deliverable

At least one logo and one ₹ on your wall. Plus a documented sales process from cold outreach to close.

PHASE 4 — MODULE COMPLETION (Weeks 7-8)

Week 7: Consent Flow Builder + User Rights Portal

Goal

Customer can embed a consent widget and a rights portal into their product in under 30 minutes. These are the two modules customers will USE most actively day-to-day.

Tasks

- Consent widget: a JavaScript SDK customer drops into their site. Renders a DPDP-compliant consent banner. Per-purpose granular consent. No pre-checked boxes. Withdrawal capability. English + Hindi minimum (other languages added on demand).
- Backend: store every consent event with full audit trail (who consented, when, to what, IP, device).
- Rights portal: another embed. User logs in, sees their data, requests access/correction/deletion. Backend routes requests to customer's admin dashboard with SLA timers.
- Add a 2-minute setup video for each.

Research

- Read the actual DPDP rules on consent (Rule 3) and rights (Rule 13). Don't ship anything that violates them.
- Test 3 existing consent management platforms (Cookieyes, Termly, Iubenda) for India use cases. Note where they fail DPDP requirements specifically.

Deliverable

Two embeddable modules with one-line install scripts. Customer integration time: under 30 minutes.

Goal

Round out the V1 module set. First paying customer has all 7 modules running in their environment. Compliance score >85%. They're sharing the trust center URL externally.

Tasks

- Breach notifier: integration with one common monitoring tool (start with Sentry or AWS GuardDuty). When triggered, generates DPB notification draft + user notification draft. Sends to customer's admin for approval. Tracks the 72-hour countdown.
- Vendor tracker: customer uploads their vendor list (CSV or via Google Sheets sync). For each vendor, we maintain compliance attestations and contract templates. Automated reminders to vendors who haven't responded.
- Move first customer from "pilot" to "fully live": their score should be 85%+, all modules deployed, trust center URL active.
- Get their first testimonial (written or video). Even a 30-second clip is gold.

Research

- Read DPDP Rule 7 (breach notification) carefully. The format and timeline are exact.
- Study how SafetyCulture and Drata handle vendor risk. Steal what works.

Deliverable

V1 is shippable. All 7 modules functional. First customer live with measurable results. Demo video updated to show the full journey.

PHASE 5 — SECOND SALES SPRINT (Week 9)

Week 9: 3-5 Active Design Partner Conversations

Goal

Close 2-4 more customers (paid or design partner status). Build the pipeline you'll demo to the accelerator in Week 12.

Tasks

- Update LinkedIn profile and X bio: "Building [name] — DPDP compliance OS for Indian SaaS. First customers live. DM to see the demo."
- Write a launch post: "We just helped [first customer] go from 32% DPDP-compliant to 87% in 3 weeks. Here's how." Include the trust center URL (with permission) and the

before/after gap report.

- Reach out to every VC firm with Indian SaaS portfolio: Blume, Stellaris, Z47, Lightspeed India, Accel India, Peak XV. Email their compliance/operations partner: "We're seeing portfolio companies hit DPDP issues. We've built a tool. Would you connect us with 1-2 of your portfolio CTOs who'd benefit?"
- Reach out to SaaSBOOMi and TiE chapters in Bengaluru, Mumbai, Hyderabad. Offer to do a free 30-minute workshop for their members on DPDP readiness — this becomes your distribution play.
- Engage with every DPDP post on LinkedIn: comment substantively, share your perspective, demonstrate expertise. Visibility compounds.

Deliverable

3-5 companies actively trialing or in serious conversation. Pipeline of 30+ founders engaged. At least 2 VC firm warm intros happening.

PHASE 6 — POLISH & PITCH PREP (Weeks 10-12)

Week 10: Onboarding Flow + Analytics

Goal

A new customer can sign up, connect their stack, generate policies, and see their compliance score — all without you on a call. Self-serve flow works.

Tasks

- Build the unguided signup. New user flows: sign up → guided onboarding wizard → connect first integration → see first compliance gap within 10 minutes.
- Add product analytics (PostHog) to track every step. Identify drop-off points.
- Add in-app chat (Crisp free tier or Chatwoot) so users can ask questions during onboarding.
- Add a public pricing page.

Deliverable

Anyone who lands on your homepage can convert to active user without needing you.

Week 11: Case Study + Landing Page V2

Goal

A landing page that converts cold traffic. A polished case study you can lead with in any pitch.

Tasks

- Rewrite the homepage. Headline: "Be DPDP-compliant in 14 days. Not 14 months." Sub: "AI-native compliance for Indian SaaS. ₹15,000/month replaces a ₹50 lakh consultant."
- Add the customer logo, the trust center URL (anonymized if needed), the before/after metrics.
- Write the first case study as a proper page on your site: "How [Customer X] went from no DPDP plan to fully compliant in 3 weeks." Include their CTO's quote, the gap report, the timeline, the rupee penalty avoided.
- Add a "Get a free DPDP risk assessment" CTA — drives top-of-funnel.

Deliverable

A site you'd be proud to send to an investor.

Week 12: Accelerator Pitch + YC Application

Goal

You're ready to walk into your university's accelerator the day classes start with a real product, real customers, real metrics, and a sharp pitch.

Tasks

The pitch deck (10 slides max):

1. **Problem** — DPDP, ₹250 crore penalty, 12 months to enforcement, 68% of companies clueless
2. **Why now** — deadline, no incumbent serving mid-market, India-specific gap nobody fills
3. **Solution** — multi-agent AI platform; one screenshot of the trust center
4. **How it works** — connect → discover → comply (one diagram)
5. **Traction** — N customers live, ₹X ARR, pipeline of Y, demo video link
6. **Market** — ₹10,000 crore over 3 years (EY), 10,000+ B2B SaaS in India
7. **Competition** — Redacto/Perfios = enterprise; Vanta = US; CA firms = expensive. Mid-market = wide open.
8. **Business model** — SaaS subscription ₹15K-60K/month + enterprise tier
9. **Team** — you + skills + why you specifically

10. **Ask** — accelerator support, intros to design partners, intros to early-stage VCs

YC application:

- Apply for the next batch (S2026 or W2027). Even if you don't get in, the application process forces you to articulate everything sharply.
- Founder video: 60 seconds. Just you, talking to camera, explaining what you've built and showing the demo. No editing tricks.
- Lead with traction: "We have N paying customers, ₹X ARR, built in 12 weeks as a student founder."

Deliverable

- Pitch deck final
- YC application submitted
- University accelerator application ready to submit Day 1 of classes
- Continuity plan: how you'll keep selling and supporting customers while studying

THE METRICS TO TRACK WEEKLY

Every Sunday evening, update this in Notion:

Metric	Week 1 Target	Week 6 Target	Week 12 Target
LinkedIn outreach sent	30	200	500
Calls completed	2	15	40
Customers paying	0	1	3-5
ARR	₹0	₹2L	₹10-15L
Pipeline (active conv)	5	15	40+
Trust center URLs live	0	1	3+
LinkedIn followers	+0	+200	+1000
Demo video views	0	500	5000+

THE THINGS THAT CAN GO WRONG (AND WHAT TO DO)

Scenario 1: Nobody responds to outreach for 2 weeks straight.

- Switch from cold to warm: ask every founder you know personally for one intro. 5 intros from existing relationships beats 100 cold messages.
- Re-examine your messaging. Test 3 different opening lines. The problem is usually the message, not the channel.
- Post a controversial DPDP take on X to attract attention. Example: "Most Indian SaaS founders think their privacy policy is consent. It's not. Here's why 80% of you are already non-compliant."

Scenario 2: Customer drops out during pilot.

- Don't panic. Ask why in detail. Almost always the answer is internal politics, not your product.
- Get the next pilot started immediately. Pipeline density solves customer churn.

Scenario 3: Building takes longer than planned.

- Ship fewer modules with higher quality rather than all 7 modules half-broken. The order is: Discovery → Gap Assessment → Trust Center → Policies → Consent → Rights Portal → Breach → Vendor. Ship the first 4 well by Week 6 if you have to drop something.

Scenario 4: You're burned out by Week 6.

- Take 2 days off. Completely. No checking emails, no thinking about the company.
- Then come back and pick up exactly where you stopped. Endurance > intensity for 12-week sprints.

Scenario 5: Real customer asks for a feature you haven't built.

- Build it for them as part of their engagement. Their use case is real. Ship custom for the first 3 customers — generalize after.

THE NON-NEGOTIABLES

These never slip, even if everything else does:

1. **Daily customer outreach.** 5 messages a day, every day. Compounds.
2. **Sunday weekly review.** Update metrics, update Notion, write Monday plan. 30 minutes.
3. **Don't pause sales for product.** The two run in parallel always.

4. **Talk to customers more than you build.** The build is informed by them, not the other way around.
 5. **Document every customer call.** Quotes, objections, asks — all in Notion. This is your future training data and pitch material.
-

WHAT YOU SHOULD HAVE BY DAY 90

When your university classes start, you walk in with:

- 3-5 paying customers (₹10-15L ARR)
- 40+ founders in active pipeline
- A working product across 7 modules
- A trust center customers are actively sharing externally
- 2-3 customer testimonials (written or video)
- A clean pitch deck
- A YC application submitted
- A LinkedIn following of 1000+ Indian SaaS founders watching what you build
- One published case study with hard numbers
- A clear path to ₹50L-1Cr ARR by end of Year 1

That is enough to walk into your accelerator and ask for the things only they can give you: VC introductions, design partner customers from their network, and the legitimacy of being a portfolio company. You don't need them to validate your business — you need them to amplify what you've already built.

The One Decision To Make Today

Pick the company name. Buy the domain. Get the GitHub org created. Don't think about it for more than 24 hours. Names are infinitely changeable; momentum is not.

Then start Week 1, Day 1. Tomorrow morning. No more research. We have enough.

The work begins now.
